A. Muir (MSSL)

Context and Overview

SARM was recommended to be activated for the first time at global scale by the scientific community and the Copernicus Services

➤ This presentation aims at giving an overview of the Sentinel-3A performances in SARM

➤ We will address:

- Performances of sea level at large scales
- Assessment of the small scale content for the sea level
- Performances of Wind&Wave parameters
- Overview of the quality over other surfaces (inland waters and land ice)

➤ Analyses of the on the fly L2 NTC products (= GDR) January 2017- Sept 2017

➤ When needed, reference to the next version of the products not yet in operations

S3A Mission Performance for the sea level

- Performances at the same level than the one measured on Jason-3 altimeter
- Room for improvement when future MSS models will reduce the errors due to new S3A ground track

Crossover SSH Error

Along track SLA std With CNES-CLS15 MSS

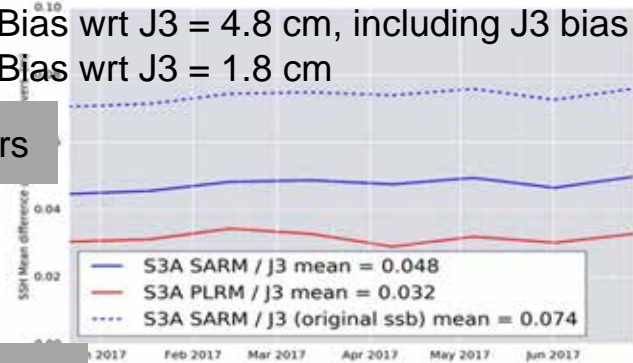

S3A Mission Performance for the sea level

➤ Negligible bias both for SARM (and PLRM) observed with 4 different metrics: SARM bias below 2 cm

Bias wrt J3 = 4.8 cm, including J3 bias
 Bias wrt J3 = 1.8 cm

S3-J3 Crossovers

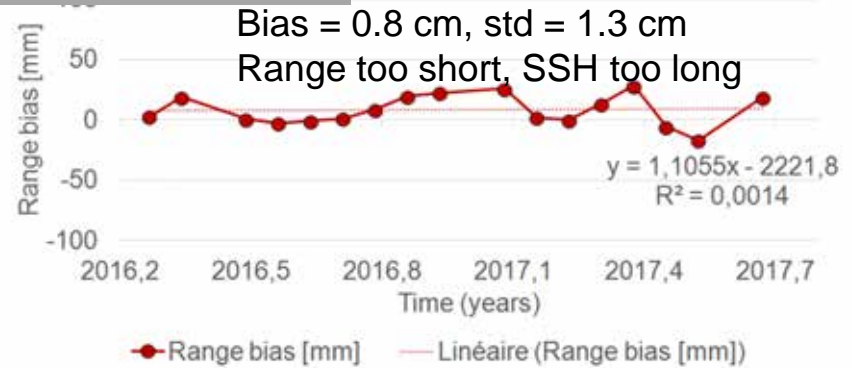

Corsica site

Senetosa, bias = 1.9 cm, std 2.8 cm
 Ajaccio, bias = 0.2 cm, std 4.3 cm

Crete Transponder Range bias

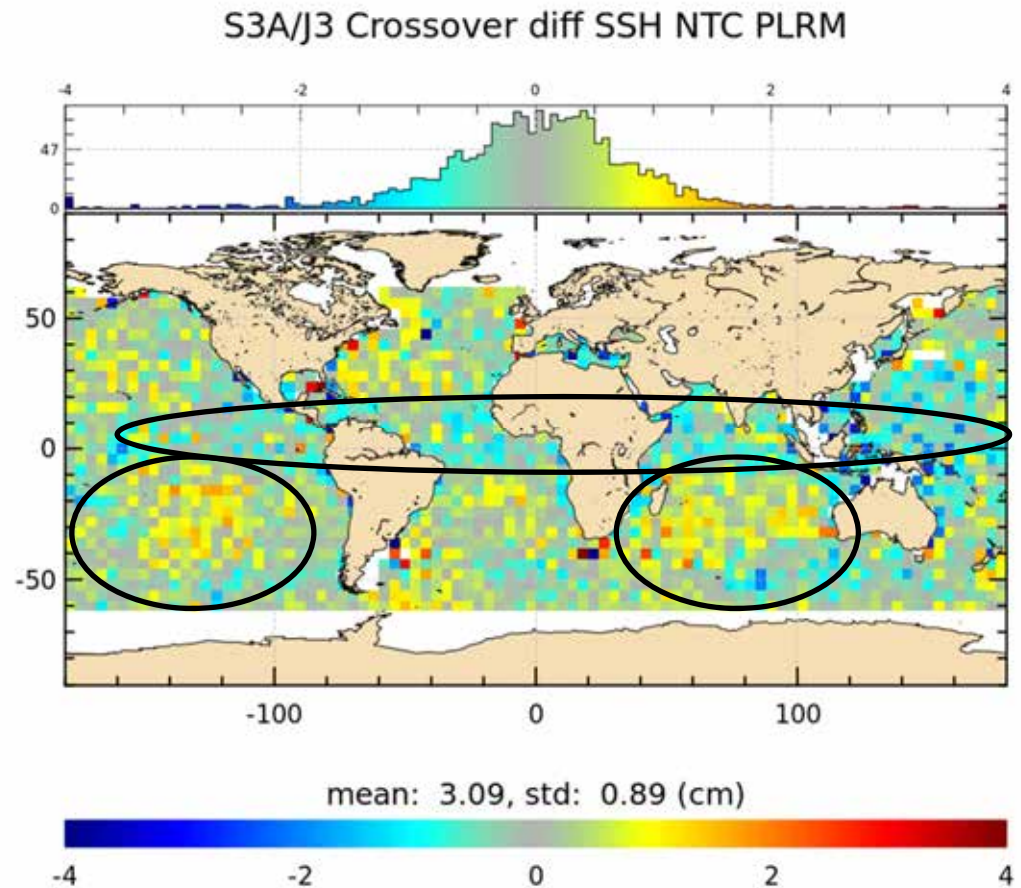

Issykkul Lake

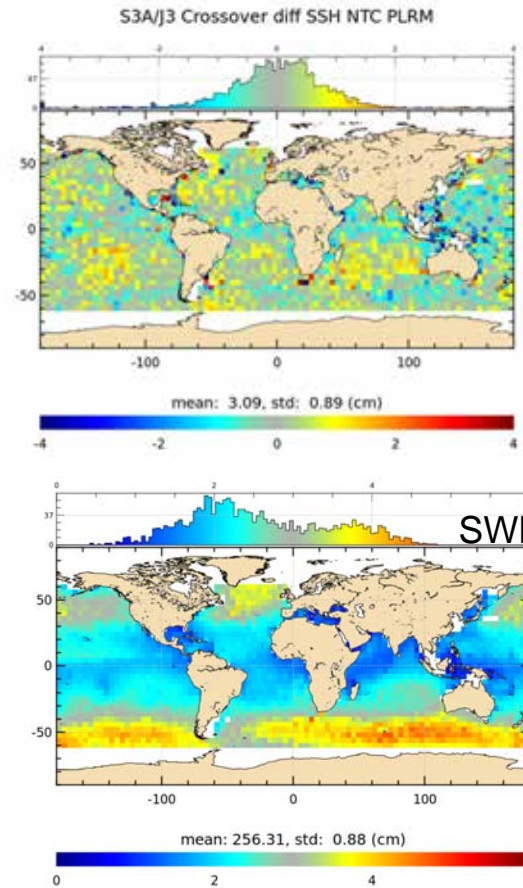

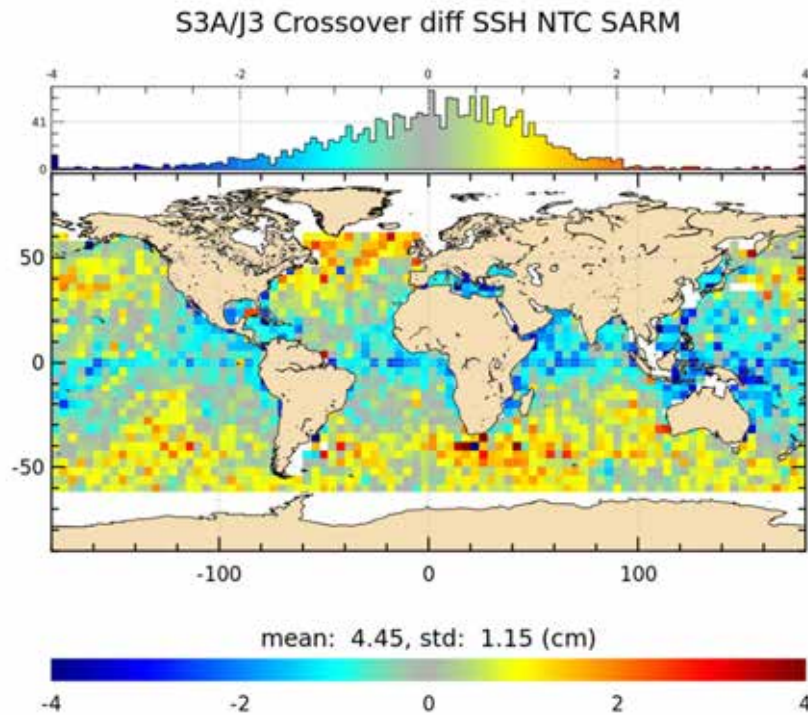

S3A Mission Performance for the sea level

- Use of PLRM mode (classical mode used for altimeters)
- When comparing sea level between S3A and Jason-3 mission, excellent agreement between both missions (below 2 cm)
- No clear signature of orbit error patterns
- Part of residual signal could be due to geophysical corrections (wet tropo and/or SSB signal) which need further fine tuning

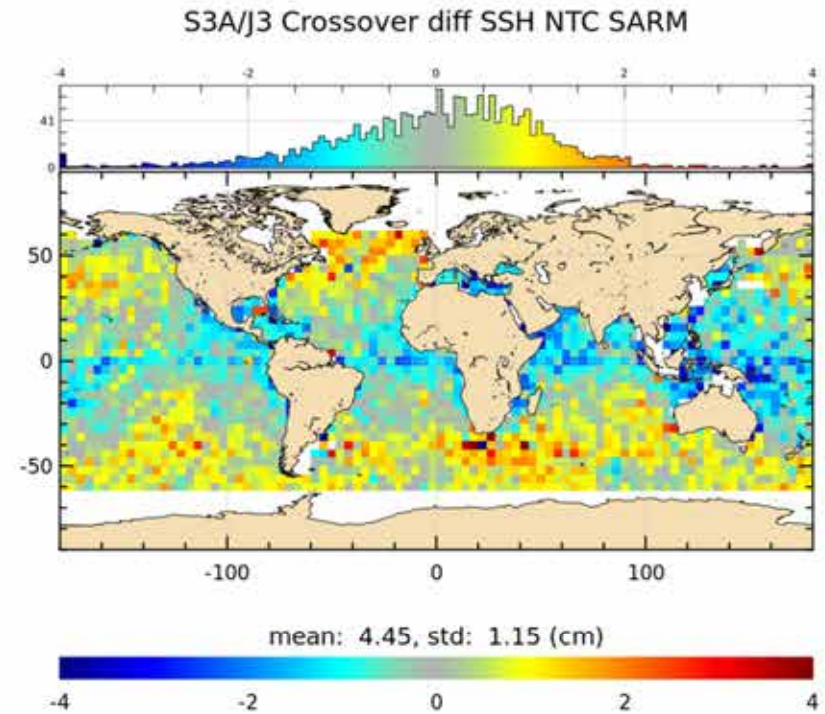

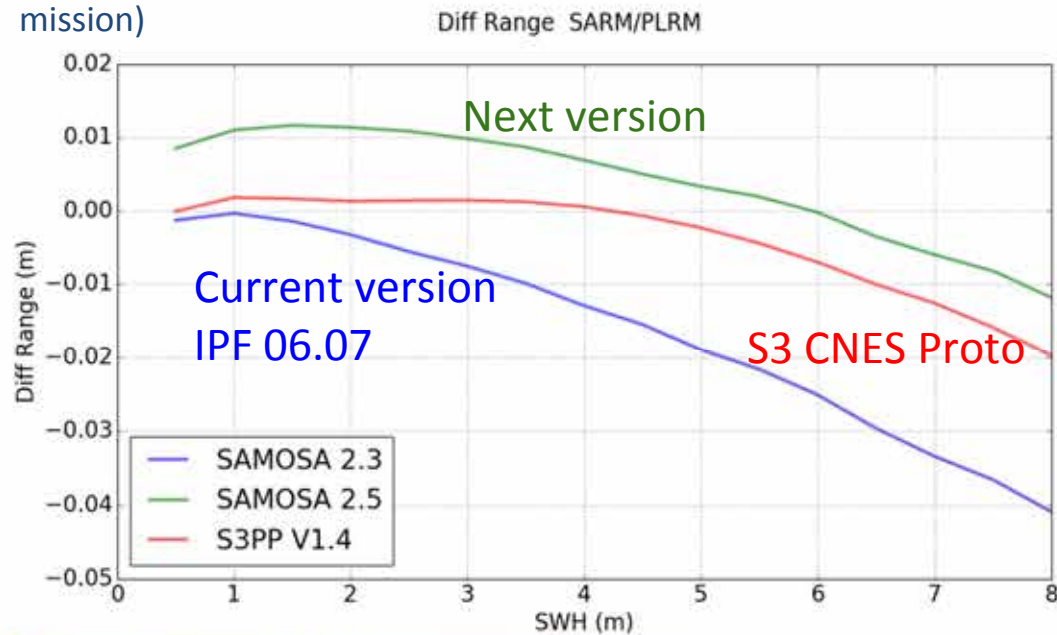

S3A Mission Performance for the sea level

➤ Some geographical patterns present for SARM correlated with SWH will be very much decreased with the next version of the products

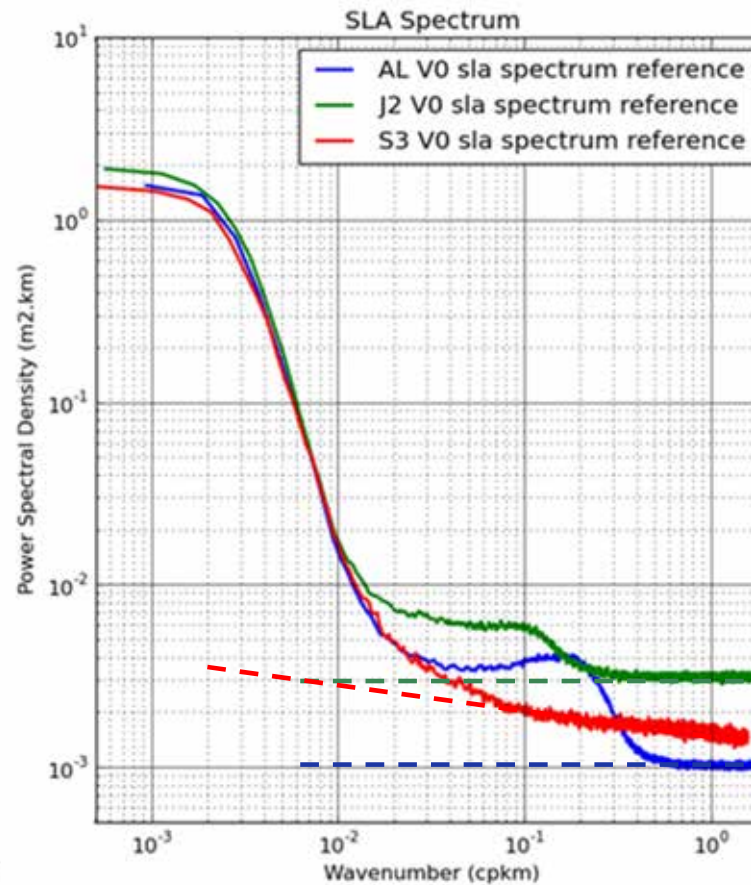

S3A Mission Performance for the sea level

- Weakness of SAMOSA 2.3 retracker in the current products => 0.5% SWH error wrt PLRM
- Error reduced with the SAMOSA 2.5 retracker (next version of S3 products)
- Very close agreement with S3PP CNES results
- Further work on L1 processing is needed to understand the residual difference for SWH > 4m (not observed with Cryosat-2 mission)

S3A Mission Performance for the sea level

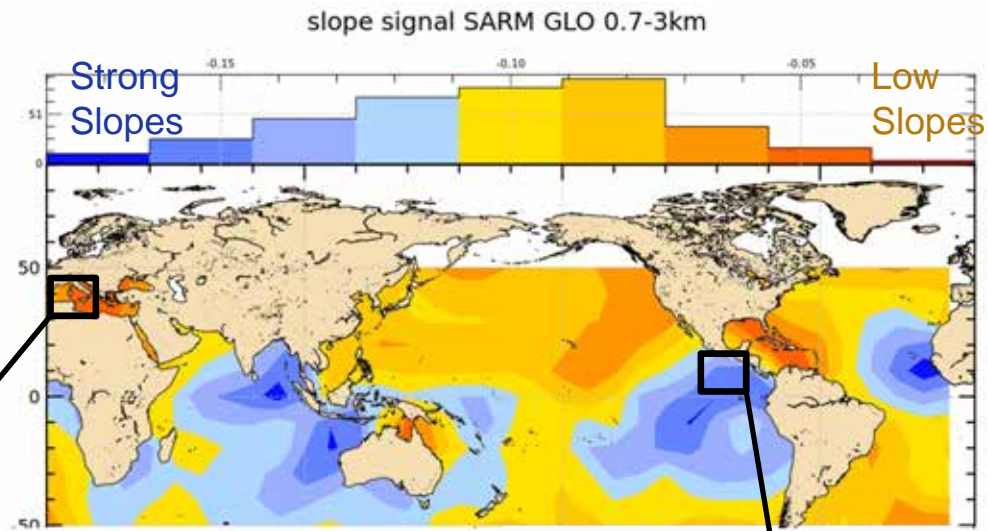

➤ While LRM altimeters present a white noise at 20 Hz, SARM data exhibit a red noise, when analysing a global PSD of sea level.

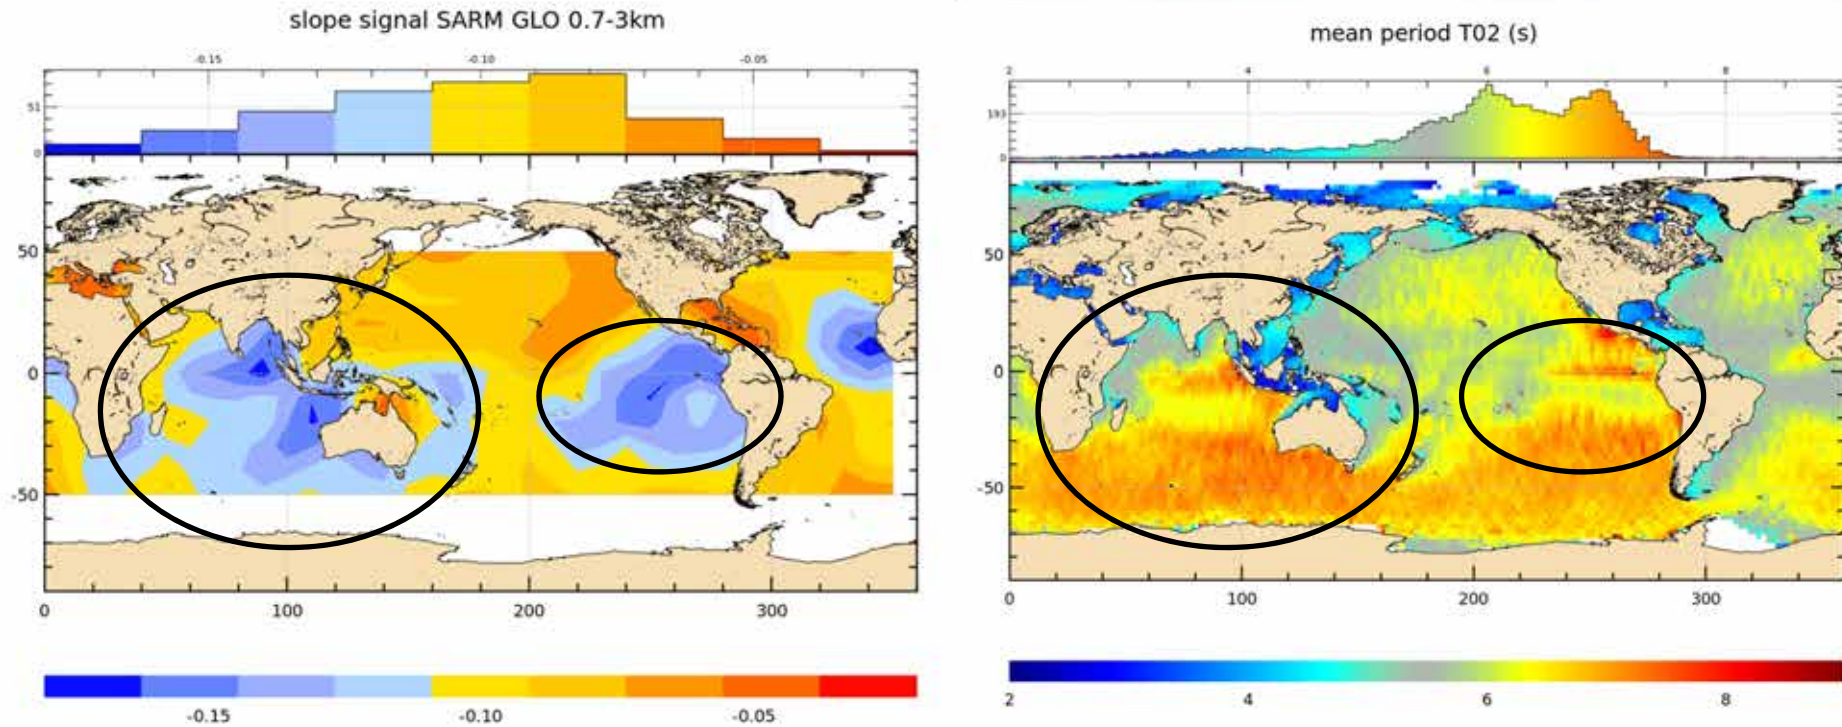

Mean map of red noise slope (1 year)

Slope x9 between both locations

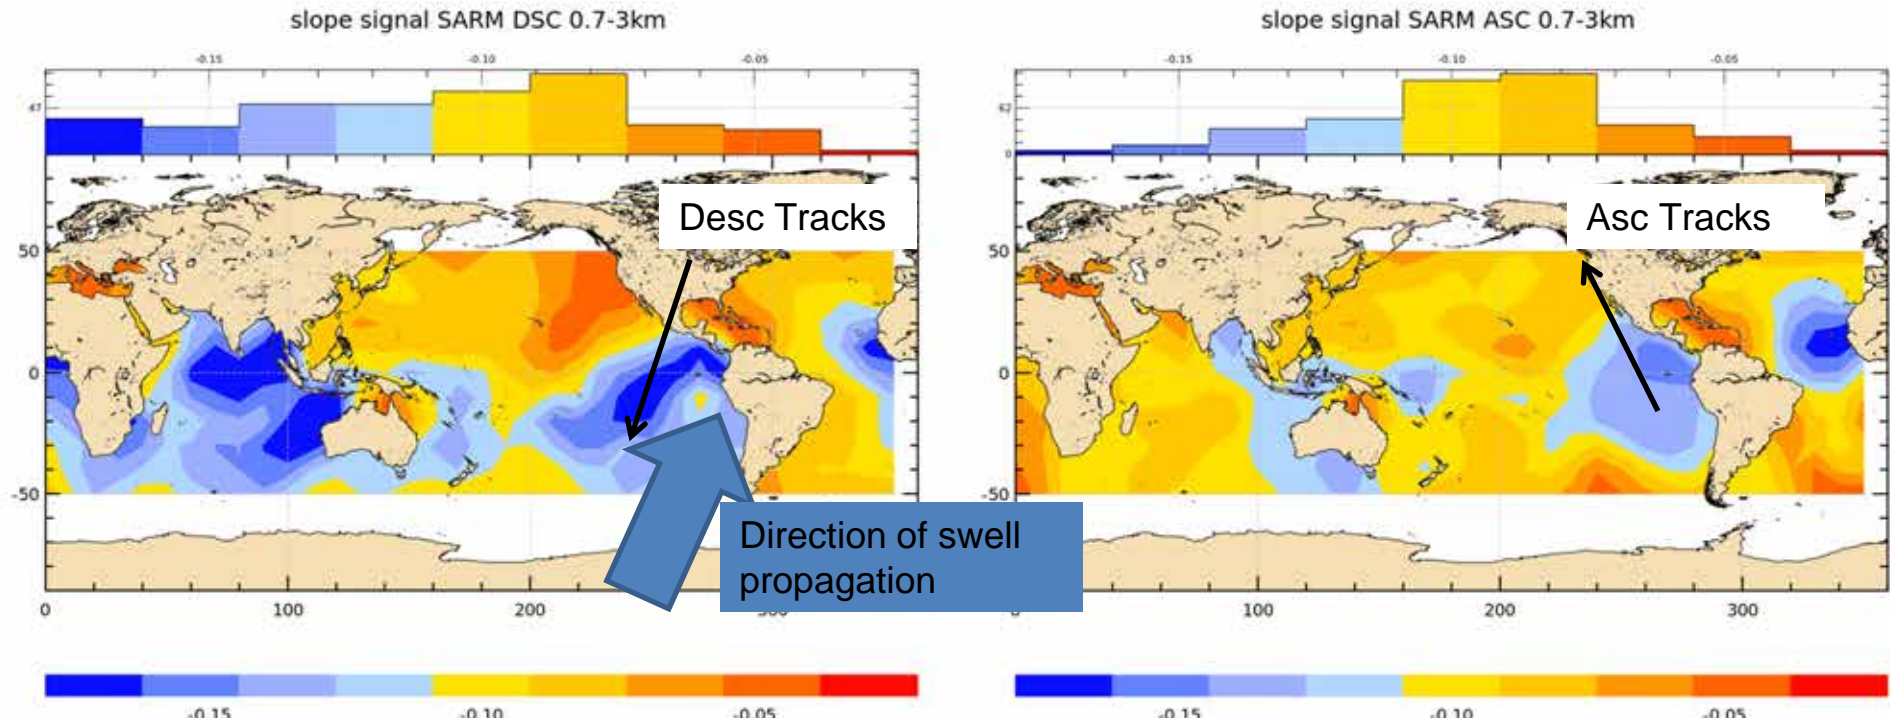

S3A Mission Performance for the sea level

- Stronger red noise slope (0.7- 3 km) are correlated with areas of swell dominated areas (better correlation in South hemisphere)
- Red noise on SARM observations of sea level are due to swell effects on SARM range

S3A Mission Performance for the sea level

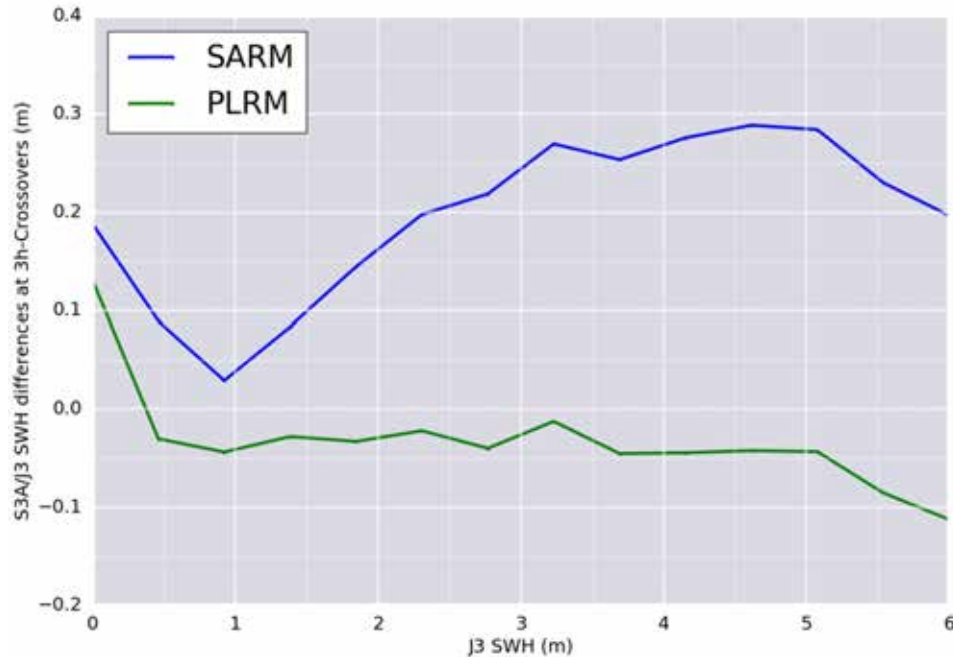

- Swell effects on S3A results from the combination of swell magnitude + angle between swell and the satellite
=> they are larger when swell propagates along the satellite tracks
- Effect is larger on the descending tracks in Pacific and Indian ocean
- Results obtained with CNES prototype. Analysis will be carried out based on the L2 operational products.

SRAL SWH assessment

SWH bias wrt Jason-3

SWH bias wrt S3A PLRM

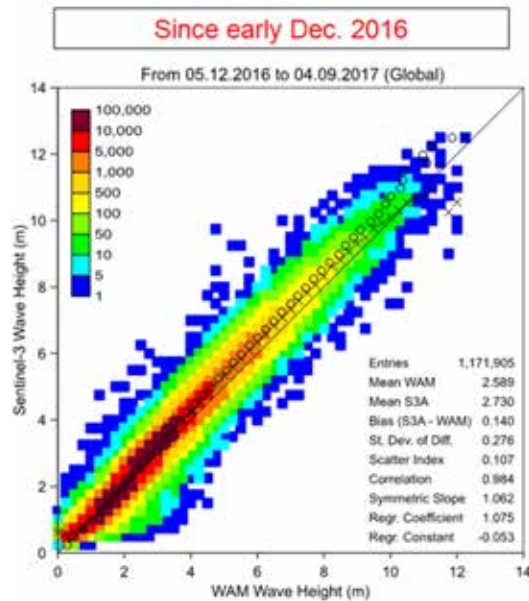

- Negligible bias for PLRM compared to Jason-3 measurements
- Presence of some biases on SARM SWH that will be reduced with the next version of the products (inclusion of SAMOSA 2.5 retracker)
- Even if improved, SARM SWH still exhibit residual errors compared to LRM altimeters

SRAL SWH assessment

SWH bias wrt WAM model

SWH bias wrt buoys

Courtesy of S.
Abdalla (ECMWF)

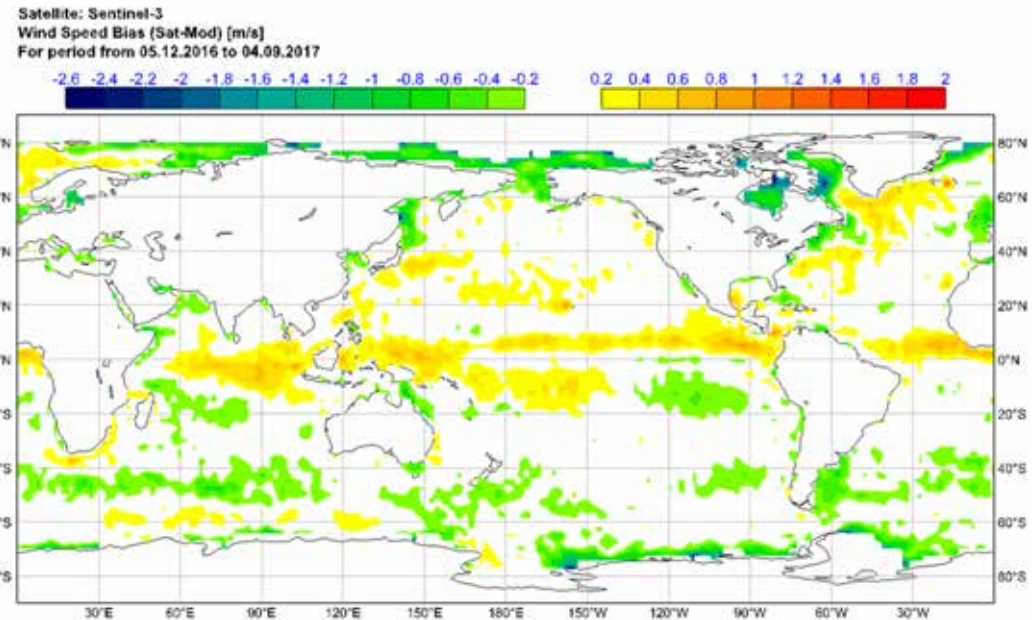

- Even if improved, SARM SWH still exhibit residual biases compared to LRM altimeters
- Error confirmed when comparing with ECMWF model

SRAL Wind Speed Assessment

- Excellent performances at large scales when comparing to model data

Since early Dec. 2016

Courtesy of S. Abdalla (ECMWF)

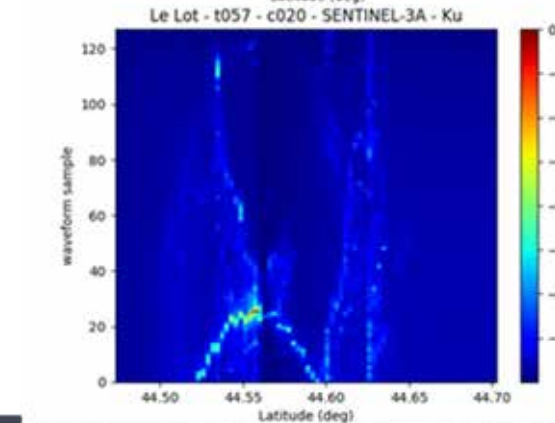

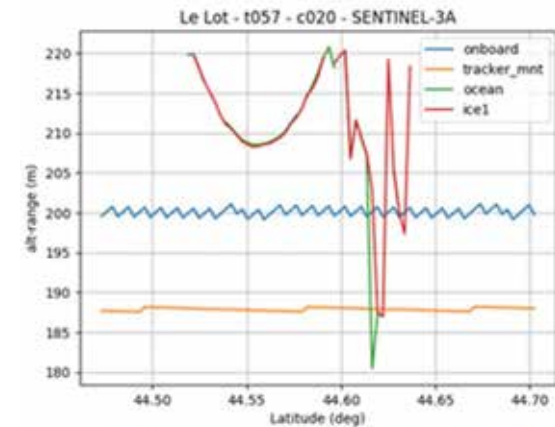

S3A Mission Performance over inland waters

- Capability to measure small rivers thanks to OLTC on board Sentinel-3A

Lot : narrow river of 150 m width

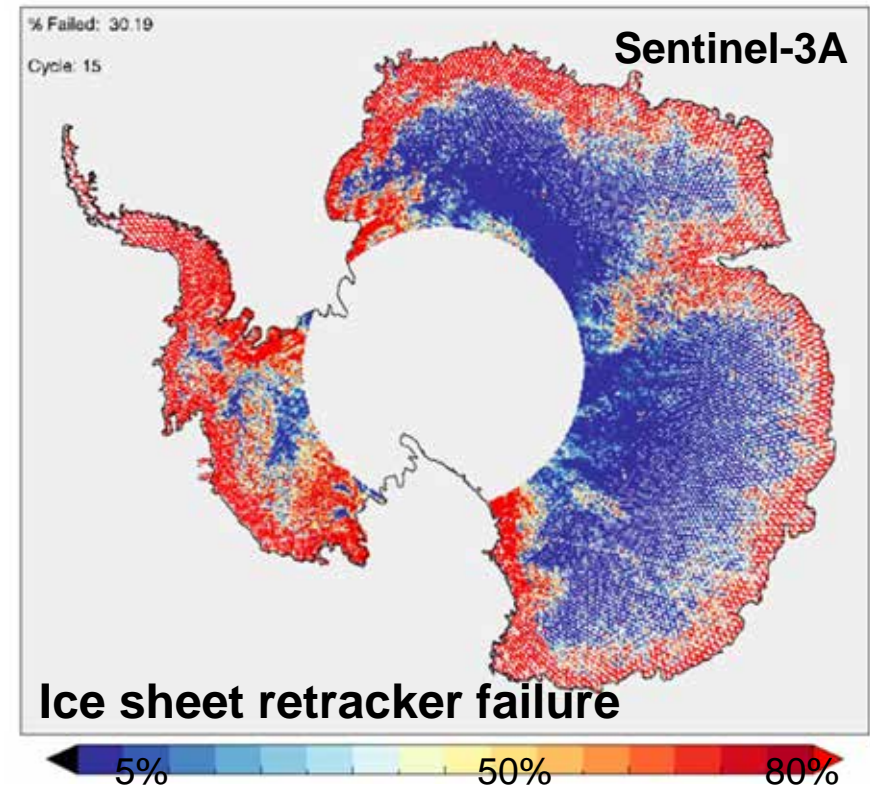

Courtesy of D. Blumstein (LEGOS)

S3A Mission Performance over land ice

- First time with acquisition in SAR mode over land ice
- Data coverage to be improved over the ice margins (thanks to ground processor evolutions)

Courtesy of A. Muir

Conclusion and perspectives

➤ Conclusion :

- Excellent data quality of the altimetry observations both for PLRM and SARM
- Sentinel-3A is the first SARM mission at global scales. We had great expectations for this new altimeter, and these requirements are met
- In the coming weeks the Marine products will be upgraded : Improved sea level and wave height
- All data quality reports are available:
<https://sentinel.esa.int/web/sentinel/technical-guides/sentinel-3-altimetry/data-quality-reports>

➤ Perspectives for the ocean observations:

- Further progress can be achieved to exploit small scale content over ocean that is impacted by swell signal
- Dedicated SARM processing are being studied to reduce swell impact (see F. Boy talk)
